

The graph shows the number of people in the world from 1950 to 2020. The population has increased from about 100 million in 1950 to 7.5 billion in 2020. The rate of increase has accelerated significantly in the last few decades.

QUESTION

The map shows the distribution of the world's population. The highest population densities are found in Europe, Asia, and North America. The lowest population densities are found in Africa, South America, and Australia.

The population of the world is growing rapidly, and this growth is putting a strain on the environment. The world's resources are being used up, and the planet is becoming more polluted. We need to find ways to slow down population growth and to use our resources more wisely.

One way to slow down population growth is to encourage people to have fewer children. This can be done by providing education and healthcare for women, and by making it easier for people to use contraception. Another way to slow down population growth is to encourage people to live more simply. This means using less energy and fewer resources, and recycling more.

We need to act now to protect our planet and our future. If we don't, the world will become a much less desirable place to live.

ANSWER

The population of the world is growing rapidly, and this growth is putting a strain on the environment. The world's resources are being used up, and the planet is becoming more polluted. We need to find ways to slow down population growth and to use our resources more wisely.
