

QUESTION

1. A beam of length L is supported at both ends. A weight W is suspended from the center of the beam. The beam sags, forming a parabolic shape. The distance from the center of the beam to the lowest point of the sag is d . The weight of the beam is negligible compared to W .

2. A beam of length L is supported at both ends. A weight W is suspended from the center of the beam. The beam sags, forming a parabolic shape. The distance from the center of the beam to the lowest point of the sag is d . The weight of the beam is negligible compared to W .

ANSWER

3. A beam of length L is supported at both ends. A weight W is suspended from the center of the beam. The beam sags, forming a parabolic shape. The distance from the center of the beam to the lowest point of the sag is d . The weight of the beam is negligible compared to W .
