

BALANCING CAPACITY AND SPACE

Water Filter Performance

Water filters are designed to remove various contaminants from your water, including chlorine, sediment, and heavy metals. The performance of a water filter is measured by its capacity and the volume of water it can filter before needing to be replaced.

Water Filter Capacity and Replacement Schedule

- 1. Capacity: The amount of water a filter can filter before it needs to be replaced.
- 2. Replacement Schedule: The frequency at which the filter should be replaced.
- 3. Filter Type: Different types of filters have different capacities and replacement schedules.
- 4. Water Quality: The quality of the water being filtered can affect the filter's performance and lifespan.

Water Filter Capacity

Filter Type	Capacity (Gallons)	Replacement Schedule
Standard	100	3-6 months
Advanced	200	6-12 months
Professional	500	12-24 months
