

A fracture of the vertebral body is a fracture of the anterior portion of the vertebral body. It is a common fracture of the spine. It is usually caused by trauma, such as a fall or a motor vehicle accident. It can be caused by a direct blow to the spine or by a flexion-distraction injury. The fracture can be complete or incomplete. It can be stable or unstable. It can be associated with other fractures of the spine.

The fracture can be treated with surgery or with non-surgical treatment. Surgery is usually required for unstable fractures. Non-surgical treatment is usually reserved for stable fractures.

The prognosis for a vertebral body fracture is generally good. Most patients recover well with appropriate treatment.

FALCETUDE

A fracture of the vertebral body with a fracture fragment displaced is a fracture of the anterior portion of the vertebral body. It is a common fracture of the spine. It is usually caused by trauma, such as a fall or a motor vehicle accident. It can be caused by a direct blow to the spine or by a flexion-distraction injury. The fracture can be complete or incomplete. It can be stable or unstable. It can be associated with other fractures of the spine.

The fracture can be treated with surgery or with non-surgical treatment. Surgery is usually required for unstable fractures. Non-surgical treatment is usually reserved for stable fractures.

The prognosis for a vertebral body fracture with a fracture fragment displaced is generally good. Most patients recover well with appropriate treatment.
