

Figure 10.10

Figure 10.10 illustrates the process of a cell dividing into two daughter cells. The diagram shows a parent cell on the left, which undergoes mitosis. The chromosomes are shown as X-shaped structures, indicating that they have replicated. The parent cell divides, resulting in two daughter cells on the right. Each daughter cell contains a complete set of chromosomes, identical to the parent cell. The process is labeled with 'Mitosis' and 'Cytokinesis'.

Figure 10.10: A diagram showing a cell dividing into two daughter cells through mitosis and cytokinesis.

Figure 10.10 illustrates the process of a cell dividing into two daughter cells. The diagram shows a parent cell on the left, which undergoes mitosis. The chromosomes are shown as X-shaped structures, indicating that they have replicated. The parent cell divides, resulting in two daughter cells on the right. Each daughter cell contains a complete set of chromosomes, identical to the parent cell. The process is labeled with 'Mitosis' and 'Cytokinesis'.
