

## QUESTION

1. A hammer is used to drive a nail into a wall. The hammer head is tilted upwards, and the handle is held by a hand. The hammer is in a state of rotation. The axis of rotation is the vertical line through the center of the hammer head. The hand applies a downward force at the end of the handle, causing the hammer head to rotate.

2. A hammer is used to drive a nail into a wall. The hammer head is tilted upwards, and the handle is held by a hand. The hammer is in a state of rotation. The axis of rotation is the vertical line through the center of the hammer head. The hand applies a downward force at the end of the handle, causing the hammer head to rotate.

## ANSWER

1. A hammer is used to drive a nail into a wall. The hammer head is tilted upwards, and the handle is held by a hand. The hammer is in a state of rotation. The axis of rotation is the vertical line through the center of the hammer head. The hand applies a downward force at the end of the handle, causing the hammer head to rotate.

2. A hammer is used to drive a nail into a wall. The hammer head is tilted upwards, and the handle is held by a hand. The hammer is in a state of rotation. The axis of rotation is the vertical line through the center of the hammer head. The hand applies a downward force at the end of the handle, causing the hammer head to rotate.
