

PROCESSES

The writing process involves the coordination of the brain, eyes, and hands. It begins with the brain sending signals to the eyes to focus on the writing surface. The hands then move the pen across the surface, creating the letters and words. This process is highly skilled and requires practice to become automatic.

The writing process is a complex task that involves the coordination of the brain, eyes, and hands. It begins with the brain sending signals to the eyes to focus on the writing surface. The hands then move the pen across the surface, creating the letters and words. This process is highly skilled and requires practice to become automatic.
