

Figure 10.10

Figure 10.10 illustrates the process of a cell dividing into two daughter cells. The diagram shows a parent cell on the left, which undergoes a series of steps to produce two daughter cells on the right. The steps are labeled with letters A through F. The parent cell contains a nucleus with chromosomes. The daughter cells each contain a nucleus with chromosomes. The process is shown in a sequence of six panels, with arrows indicating the progression from left to right.
