

The cell wall is the outermost layer of the cell, providing structural support and protection. The cell membrane is located just inside the cell wall, regulating the movement of substances in and out of the cell. The nucleus is the control center of the cell, containing genetic material. The vacuole is a large, fluid-filled sac that maintains turgor pressure. Chloroplasts are organelles where photosynthesis occurs, converting light energy into chemical energy. Mitochondria are the powerhouses of the cell, where cellular respiration takes place to produce energy.

FALCETILE

Falsetto is a vocal register characterized by a high, breathy, and often nasal quality. It is produced by stretching the vocal cords and vibrating the upper part of the larynx.
