North	15	15.0
South	85	85.0
Total	100	100.0

DISCUSSION

The 1998-1999 season was characterized by a high number of cases in the South, with 88 cases reported. This was followed by the 2000-2001 season, which also saw a high number of cases in the South, with 85 cases reported. The North region consistently reported a smaller number of cases, with 12 cases in 1998-1999 and 15 cases in 2000-2001. The data indicates a strong regional concentration of cases in the South, which may be due to various factors such as population density, climate, or local transmission dynamics. The overall trend shows a high prevalence of cases in the South across both seasons, with the total number of cases remaining relatively stable between the two periods.

Area	Number of cases	Percentage of total cases
North	15	15.0
South	85	85.0
Total	100	100.0
