

### THEORY

When a body is placed in a liquid, it experiences an upward force called buoyant force. This force is equal to the weight of the liquid displaced by the body. This is known as Archimedes' principle. The buoyant force depends on the volume of the liquid displaced and the density of the liquid. If the buoyant force is greater than the weight of the body, it will float. If it is less, it will sink. If it is equal, it will be suspended in the liquid.
