IGNITION

Component	Function
Battery	Power source
Ignition Switch	Controls current flow
Ignition Coil	Converts low voltage to high voltage
Distributor	Distributes high voltage to spark plug
Spark Plug	Creates spark for combustion

The ignition system is responsible for providing the spark that ignites the fuel mixture in the combustion chamber. The battery provides the power to the ignition switch, which controls the flow of current to the ignition coil. The ignition coil converts the low-voltage current from the battery into a high-voltage spark. The distributor then distributes this high-voltage current to the spark plug, which creates the spark that ignites the fuel mixture.

The ignition system is a critical component of the engine, and it is important to ensure that it is properly maintained. Regularly checking the battery, ignition switch, ignition coil, distributor, and spark plug can help prevent ignition-related problems and ensure that the engine runs smoothly.
