

## QUESTION

The Golgi apparatus is a series of flattened, stacked sacs (cisternae) that process and package proteins. It is located between the rough endoplasmic reticulum (RER) and the smooth endoplasmic reticulum (SER). The Golgi apparatus is involved in the transport of proteins and lipids from the RER to the SER and to the cell membrane. It is also involved in the synthesis of polysaccharides and the modification of proteins.

QUESTION

## FACTFILE

The Golgi apparatus is a series of flattened, stacked sacs (cisternae) that process and package proteins. It is located between the rough endoplasmic reticulum (RER) and the smooth endoplasmic reticulum (SER). The Golgi apparatus is involved in the transport of proteins and lipids from the RER to the SER and to the cell membrane. It is also involved in the synthesis of polysaccharides and the modification of proteins.
