

EXHAUST

(See page 2)

The exhaust system is designed to remove the combustion products from the engine. It consists of the exhaust manifold, exhaust pipe, and catalytic converter. The exhaust manifold is located at the rear of the engine block and is connected to the exhaust pipe. The exhaust pipe is a long, narrow tube that runs through the length of the engine compartment. The catalytic converter is located at the rear of the engine compartment and is used to reduce the amount of pollutants in the exhaust.

The exhaust system is designed to be as quiet as possible. The catalytic converter is located in a sound-dampening enclosure. The exhaust pipe is also designed to be as quiet as possible. The exhaust manifold is also designed to be as quiet as possible.

The exhaust system is designed to be as durable as possible. The exhaust manifold is made of cast iron. The exhaust pipe is made of stainless steel. The catalytic converter is made of a special alloy.
