

ANATOMY

The eye is a complex organ that allows us to see. It consists of several parts that work together to capture light and send signals to the brain. The cornea is the clear front part of the eye. The iris is the colored part of the eye. The pupil is the opening in the center of the iris. The lens is a clear, biconvex structure that focuses light on the retina. The ciliary muscles and ciliary body control the shape of the lens. The vitreous body is a clear, gel-like substance that fills the eye. The retina is the light-sensitive layer at the back of the eye. The optic nerve carries signals from the retina to the brain.
