

A fracture of the vertebral body is a fracture of the anterior portion of the vertebral body. It is a common fracture of the spine. The fracture line is usually horizontal and extends through the anterior wall of the vertebral body. The fracture may be complete or incomplete. The fracture may be associated with a fracture of the superior or inferior endplate. The fracture may be associated with a fracture of the posterior wall. The fracture may be associated with a fracture of the transverse process. The fracture may be associated with a fracture of the spinous process. The fracture may be associated with a fracture of the lamina. The fracture may be associated with a fracture of the pedicle. The fracture may be associated with a fracture of the neural arch. The fracture may be associated with a fracture of the neural foramen. The fracture may be associated with a fracture of the neural canal. The fracture may be associated with a fracture of the vertebral canal. The fracture may be associated with a fracture of the vertebral foramen. The fracture may be associated with a fracture of the vertebral body.

## FALCETUDE

A fracture of the superior endplate of a thoracic vertebra is a fracture of the superior endplate. It is a common fracture of the spine. The fracture line is usually horizontal and extends through the superior endplate. The fracture may be complete or incomplete. The fracture may be associated with a fracture of the inferior endplate. The fracture may be associated with a fracture of the anterior wall. The fracture may be associated with a fracture of the posterior wall. The fracture may be associated with a fracture of the transverse process. The fracture may be associated with a fracture of the spinous process. The fracture may be associated with a fracture of the lamina. The fracture may be associated with a fracture of the pedicle. The fracture may be associated with a fracture of the neural arch. The fracture may be associated with a fracture of the neural foramen. The fracture may be associated with a fracture of the neural canal. The fracture may be associated with a fracture of the vertebral canal. The fracture may be associated with a fracture of the vertebral foramen. The fracture may be associated with a fracture of the vertebral body.
