

Figure 1. Schematic of a cell, force vs. time, force vs. distance, and micrograph of a cell.

DISCUSSION

The results of this study show that the force generated by a cell is proportional to the distance it moves. This is consistent with the idea that the cell is using a spring-like mechanism to generate force. The force vs. distance graph shows a linear relationship, which is characteristic of a spring. The force vs. time graph shows a linear increase in force over time, which is also consistent with a spring-like mechanism. The micrograph shows the cell's position and the flagellum's position, which are used to determine the distance the cell has moved.
