

The graph shows the relationship between the number of fish and the number of fishers. The number of fish increases as the number of fishers increases, up to a point. After this point, the number of fish decreases as the number of fishers continues to increase. This is because as more fishers are added, the fish are overharvested, leading to a decline in the fish population.

QUESTION

The graph shows the relationship between the number of fish and the number of fishers. The number of fish increases as the number of fishers increases, up to a point. After this point, the number of fish decreases as the number of fishers continues to increase. This is because as more fishers are added, the fish are overharvested, leading to a decline in the fish population.
