

ANATOMY

Structure	Function
Ciliary Muscles	Contract to thicken the lens for near vision.
Iris	Controls the size of the pupil.
Pupil	Opening through which light enters the eye.
Lens	Refracts light to focus it on the retina.
Vitreous Body	Maintains the shape of the eye and transmits light.
Retina	Receives light and converts it into neural signals.
Choroid	Provides nutrients to the eye and absorbs excess light.
Sclera	Protects the eye and maintains its shape.
Optic Nerve	Transmits visual information from the retina to the brain.
