

## PROCESSES

The diagram illustrates the processes involved in the development of a product. It shows a flow from the initial concept to the final product, with various stages and milestones. The process is divided into several phases, including the initial concept, the development phase, and the production phase. The initial concept phase involves the identification of a need and the development of a preliminary design. The development phase involves the detailed design and the production of a prototype. The production phase involves the final design and the production of the final product. The diagram also shows the flow of information and the coordination of resources throughout the process.

Phase	Activity	Duration	Resources
Concept	Identify need	2 weeks	1 person
Concept	Develop preliminary design	2 weeks	1 person
Development	Detailed design	4 weeks	2 people
Development	Production of prototype	4 weeks	2 people
Production	Final design	2 weeks	1 person
Production	Production of final product	4 weeks	2 people
