

February 11, 2025

**To:** Whom it may concern,  
**From:** Building Drops, Inc.  
**On behalf of:** Glass Warehouse/Future Glass  
1319 Rocky Point Drive, Suite 200  
Oceanside, CA 92056  
**Report:** PER 9534  
**Subject:** DOR-BPRD Glass Spigot Clamping System

**Scope:**

The purpose of this report is to evaluate the performance of the DOR-BPRD Spigot Clamping System manufactured by Glass Warehouse. The conditions in this report meet all the applicable requirements of the current International Building Code. Glass thicknesses and properties were extracted from ASTM E1300. Steel members and connections were designed according to AISC Design Guides. ICC Acceptance Criteria AC439 and ASTM E2358 were used for determining applicable design criteria for railing systems. A summary of standards can be found on the following pages.

Only rectangular glass is covered within this report, different glass shapes do not apply to this analysis. Gaskets may be modified according to different glass thicknesses as long as thickness is specified in this analysis.

For fall protection requirements, this product has been analyzed in accordance with section 1607.9.1 and meets the requirements of the 50 plf linear load and 200 lb concentrated load specified in ASCE 7 section 4.5.1.

The glass spigot system uses 2205 stainless steel clamps to point support the glass lights specified herein. The glass spigot system has been designed for the following loading conditions:

- 200 lb concentrated load at the top of glass or at the top rail
- 50 lbs linear load applied at the top of glass or at the top rail
- Allowable wind load as shown on the tables within this report

This report provides glass thicknesses the spigots have been designed to support. Other glass thicknesses may be used but are outside of the scope of this report.

**Instructions for Use**

1. Select desired glass composition from tables 5, 7, 8, 9, 10, 11, or 12.
2. Determine max. glass size based on wind load requirements.
3. Using table 13, verify that the allowable installation load at desired size is greater than the allowable wind load of the desired glass size.

**Limits of Use:**

1. This product has been evaluated and is in compliance with the 2015, 2018, and 2021 editions of the International Building Code.
2. Product installation shall be as listed herein. Site conditions that deviate from those specified shall require further engineering analysis by a licensed engineer or registered architect.
3. When used in areas requiring wind borne debris protection this product complies with chapter 16 of the 2015, 2018, and 2021 editions of the International Building Code and does require an impact resistant covering in areas requiring impact resistance.

**Conclusion:**

In my professional opinion, the DOR-BPRD Spigot Clamping System manufactured by Glass Warehouse is adequate for use under the limitations provided within this report.

I trust that this will satisfy your needs, however, feel free to call if you have any questions.

**Certification of Independence:** Please note that I do not have nor will I acquire a financial interest in any company manufacturing or distributing the product(s) for which this report is being issued. Also, I do not have nor will I acquire a financial interest in any other entity involved in the approval process of the listed product(s).

**Wind Loads on Fences or Guards**

The wind load table below has been calculated in accordance with ASCE 7 section 29.4, Design Wind Loads on Solid Freestanding Wall and Solid Signs. This section is applicable for free standing building guard rails, wind walls, and balcony railings that return to building walls. The values listed in the table below are generic values for heights up to 15 ft and may not reflect the values needed for a specific jobsite. If site specific wind loads are required, a licensed engineer shall prepare site specific wind loads for use with this product.

**Cap Rail Allowable Span Calculations**

Guard applications require a top rail or handrail. The rail shall have adequate strength to support the live load of 200 lb concentrated or 50 plf distributed load assuming the failure of one glass light at the location of the loading. No US building codes or adopted standards define the limit state of the guard cap rail for this condition. IBC 2407.1.2 states “shall be otherwise supported to remain in place should one baluster fail.” There is no additional explanation in the IBC as to how this is to be determined. ICC Acceptance Criteria 439 was adopted to provide a methodology for determining if a glass balustrade guard meets the requirements of IBC 2407. ICC AC 439 requires the rail to be capable of supporting a 334# load (SF = 1.67 for 200# load) with no more than 12” deflection, yielding or other damage is permitted since the loss of a glass light will necessitate guard repairs. For light failure only the horizontal load case applies for laminated glass.

**1/4 + 0.06 PVB ES + 1/4 = 9/16 Laminated Glass**

Glass Ply 1 Nominal Thickness: 1/4 in  
 Glass Ply 2 Nominal Thickness: 1/4 in  
 Interlayer Type: PVB ES  
 Interlayer Complex Shear Modulus: 246.56 psi

Laminate Nominal Thickness: 9/16 in  
 Glass Temper: Fully Tempered:

Glass Ply 1 min. Thickness (h1): 0.219 in  
 Glass Ply 2 min. Thickness (h2): 0.219 in  
 Interlayer Thickness (hv): 0.060 in

Laminate Minimum Thickness (hs): 0.279 in  
 Ply 1 weighted Thickness (hs1): 0.140 in  
 Ply 2 weighted Thickness (hs2): 0.140 in

Glass Inertia (Is): 0.0085 in<sup>3</sup>
