

The diagram illustrates the mechanical configuration of the system. The motor and actuator are connected to the pulley and shaft assembly, which is supported by a bracket and support structure. The pulley is used to transmit motion from the motor to the shaft. The shaft is connected to the actuator, which provides the driving force for the system. The bracket and support structure ensure the stability and proper alignment of the components.

QUESTION

The diagram illustrates the mechanical configuration of the system. The motor and actuator are connected to the pulley and shaft assembly, which is supported by a bracket and support structure. The pulley is used to transmit motion from the motor to the shaft. The shaft is connected to the actuator, which provides the driving force for the system. The bracket and support structure ensure the stability and proper alignment of the components.

Answer:
