

**QUESTION**

1. A patient with a long history of alcohol abuse presents with a 2-week history of weight loss, weakness, and a 10-degree fever. Physical examination reveals a 10-degree fever, tachycardia, and a 10-degree fever. Laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The patient's chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever. The patient's chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.

**ANSWER**

1. The patient's symptoms and physical examination findings are consistent with a diagnosis of alcoholic liver disease. The weight loss, weakness, and fever are common symptoms of liver disease. The physical examination findings of a 10-degree fever, tachycardia, and a 10-degree fever are also consistent with liver disease. The laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.

**QUESTION**

2. A patient with a long history of alcohol abuse presents with a 2-week history of weight loss, weakness, and a 10-degree fever. Physical examination reveals a 10-degree fever, tachycardia, and a 10-degree fever. Laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The patient's chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever. The patient's chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.

**ANSWER**

2. The patient's symptoms and physical examination findings are consistent with a diagnosis of alcoholic liver disease. The weight loss, weakness, and fever are common symptoms of liver disease. The physical examination findings of a 10-degree fever, tachycardia, and a 10-degree fever are also consistent with liver disease. The laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.

## ANSWERS

1. The patient's symptoms and physical examination findings are consistent with a diagnosis of alcoholic liver disease. The weight loss, weakness, and fever are common symptoms of liver disease. The physical examination findings of a 10-degree fever, tachycardia, and a 10-degree fever are also consistent with liver disease. The laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.

2. The patient's symptoms and physical examination findings are consistent with a diagnosis of alcoholic liver disease. The weight loss, weakness, and fever are common symptoms of liver disease. The physical examination findings of a 10-degree fever, tachycardia, and a 10-degree fever are also consistent with liver disease. The laboratory studies show a white blood cell count of 12,000/mm<sup>3</sup> with a left shift, a hemoglobin of 10 g/dL, and a hematocrit of 30%. The chest X-ray shows a 10-degree fever, tachycardia, and a 10-degree fever.
