

The cell wall is the outermost layer of the cell, providing structural support and protection. It is composed of cellulose, hemicellulose, and pectin. The cell membrane is a phospholipid bilayer that regulates the movement of substances in and out of the cell. The nucleus is the control center of the cell, containing genetic material (DNA) and a nucleolus. The vacuole is a large, fluid-filled sac that stores water, nutrients, and waste products. The cytoplasm is the fluid-filled space between the cell membrane and the nucleus, containing various organelles and molecules.

The cell wall is a rigid structure that surrounds the cell, providing structural support and protection. It is composed of cellulose, hemicellulose, and pectin. The cell membrane is a phospholipid bilayer that regulates the movement of substances in and out of the cell. The nucleus is the control center of the cell, containing genetic material (DNA) and a nucleolus. The vacuole is a large, fluid-filled sac that stores water, nutrients, and waste products. The cytoplasm is the fluid-filled space between the cell membrane and the nucleus, containing various organelles and molecules.

PLANT CELL

The cell wall is the outermost layer of the cell, providing structural support and protection. It is composed of cellulose, hemicellulose, and pectin. The cell membrane is a phospholipid bilayer that regulates the movement of substances in and out of the cell. The nucleus is the control center of the cell, containing genetic material (DNA) and a nucleolus. The vacuole is a large, fluid-filled sac that stores water, nutrients, and waste products.
