

The diagram illustrates the process of aligning a square tile with a hole in a rectangular block. A hand is shown holding the tile, which has a circular hole in its center. The tile is being lowered towards the block, which also has a circular hole. A vertical line is drawn through the center of both holes to show they are perfectly aligned.

This step is crucial for ensuring that the tile fits snugly into the block without any gaps or misalignment.

FACE TILE

The diagram shows two different scenarios for face tiles. In the first, a tile is aligned with a hole in a block. In the second, a tile is shown above a block that does not have a hole, suggesting a different application or a different type of block.
