Turning Science into Care

Specialty Feeding Products

Keeping baby at the breast helps preserve the mother-baby bond. Babies with severe feeding problems due to premature birth, failure-to-thrive, or specific impairments such as neurological challenges, may require special feeding assistance. Medela offers a wide range of specialty feeding products designed to help mothers and their babies overcome circumstances that might otherwise impede a successful breastfeeding experience.

SpecialNeeds® Feeders

The SpecialNeeds Feeder is a clinically trusted solution for babies who experience difficulty breastfeeding because of conditions such as cleft palate, neurological disorders, or oral motor dysfunction. Its innovative design allows controlled milk flow, enabling safe and efficient feeding without requiring suction.

SoftFeeder™

Designed for situations where cup feeding is recommended, the Softfeeder helps babies receive nutrition without creating nipple confusion or preference. Its unique design supports oral development and ensures a smooth transition to breastfeeding when ready.

Supplemental Nursing System™

Specifically designed to support breastfeeding or chestfeeding by delivering milk to the baby while they feed at the breast or chest. This system helps maintain the natural feeding experience, encourages bonding, and promotes milk production. Ideal for long-term use when supplementation is needed without introducing bottles or causing nipple confusion.

Starter SNS™

Designed for temporary use (up to 24 hours), this system provides milk to the baby while they feed at the breast or chest, supporting natural feeding and bonding. Ideal for short-term supplementation without introducing bottles or causing nipple confusion.
