CONCLUSIONS

The study has shown that the number of cases has increased significantly over the period from 1995 to 2030. The data indicates a steady upward trend, with the number of cases rising from 10 in 1995 to 185 in 2030. This suggests a consistent and accelerating growth in the number of cases over the 35-year period. The increase is most pronounced in the later years, with a rise of 5 cases per year from 2020 onwards. The overall trend is clearly positive, indicating a significant and sustained increase in the number of cases over time.
